COMP 3920 Database Systems 1

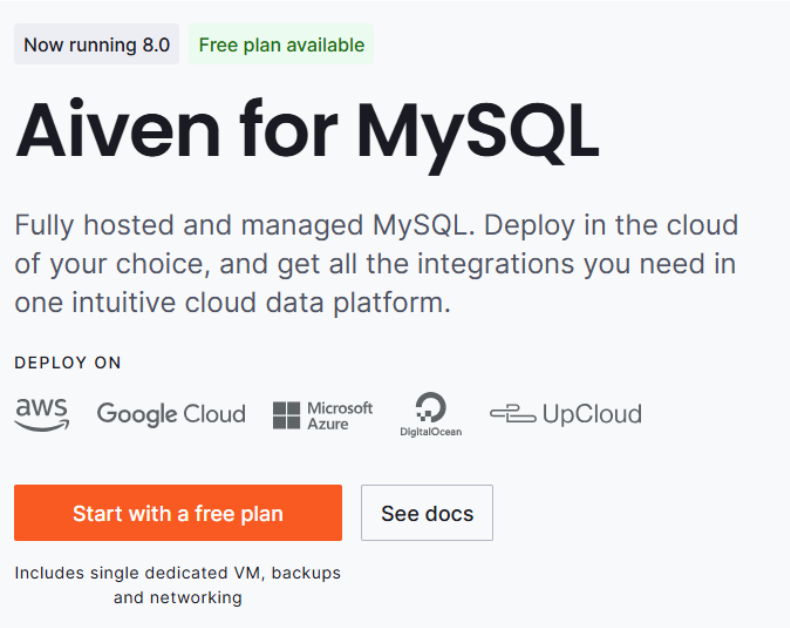
Aiven DB

Introduction:
The goal of this document is to serve as a walkthrough of creating an account with Aiven.io.

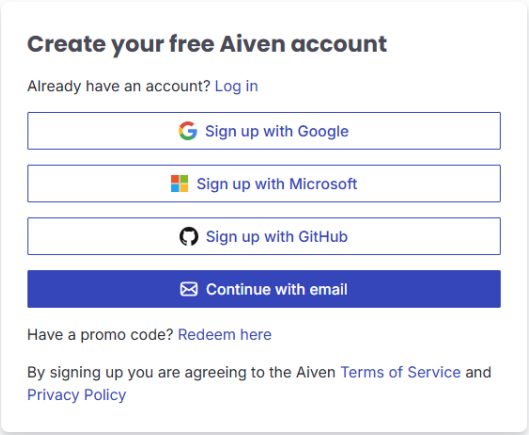
Aiven.io provides a small to medium-sized (<5GB) MySQL databases for free for use in development and testing environments. This is perfect for us if we just need a quick and easy database that can be accessed freely on the internet. Remember, if we were to just use a database on our localhost, only we could see it (no one else can access our localhost).

Step 1: Create a Aiven.io account.

Go to https://aiven.io/mysql and register for a new account (if you don't already have one).

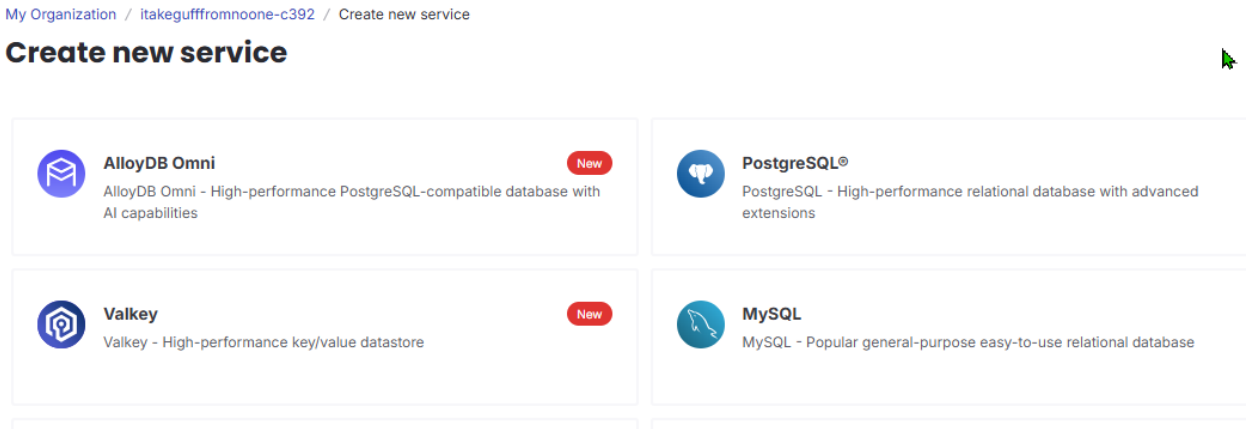


Complete the standard register information and verify your email.



Step 2: Create a new MySQL database.

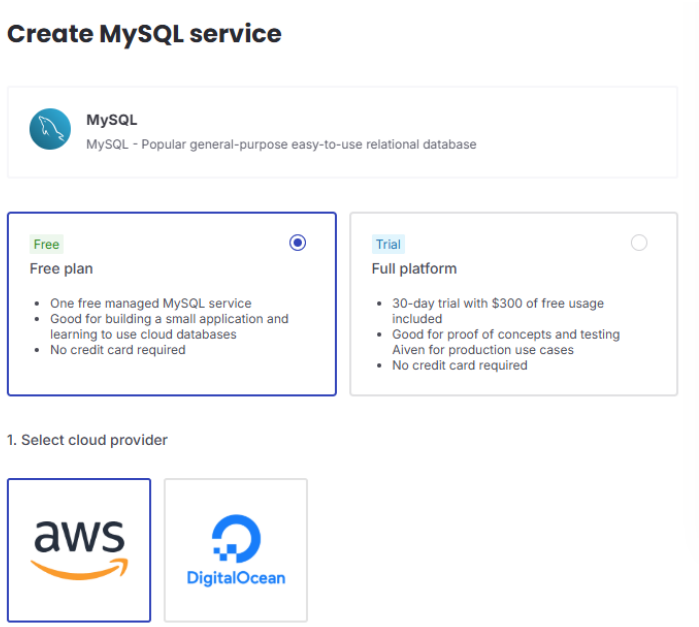
Once you are logged in to your new Aiven.io account, you should see a dashboard panel like this:



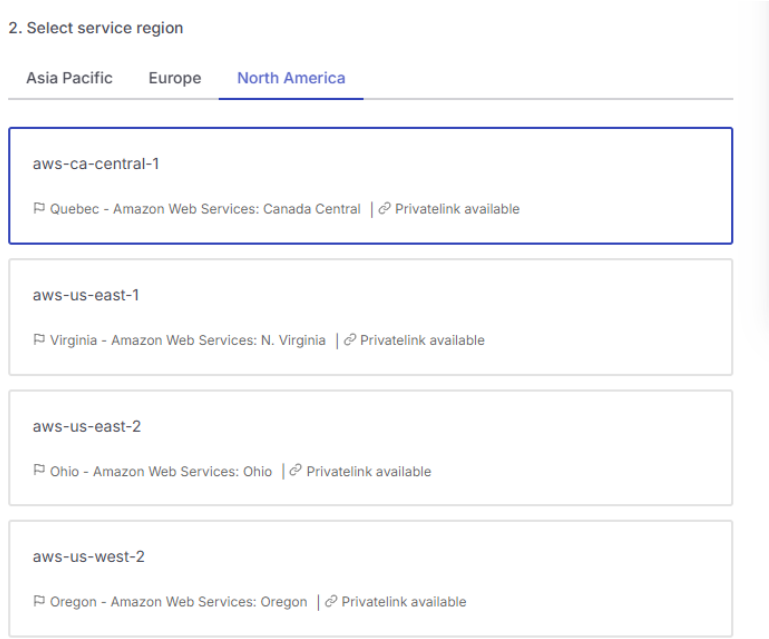
Click on MySQL to create a new free Database.

Select "Free Plan".

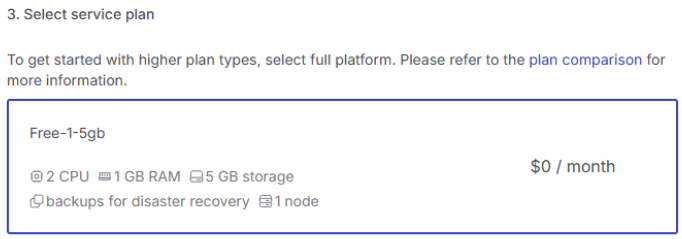
Select Provider. You can pick either AWS or Digital Ocean; for our purposes, I don't think it makes much difference.



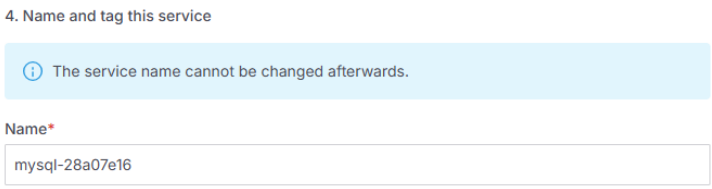
Select a region: Again, I don't think the region really matters for our projects here.



Pick the free service plan.

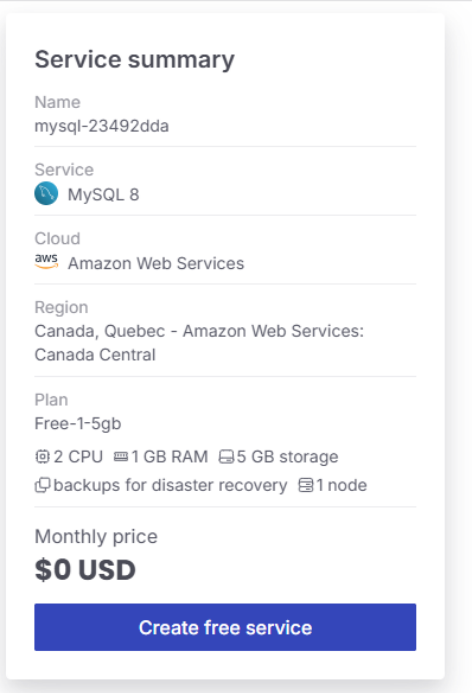


Give your Database a name.



Confirm that the Monthly price is $0.

Click "Create Free Service".



You should now have the details to connect to your database.

- Host
- Port
- Database Name
- User
- Password

Service URI	mysql://avnadmin:AVNS_[redacted]mAX5@mysql-23492dda-[redacted]-c392.e.aivencloud.com:16879/defaultdb?ssl-mode=REQUIRED
Database name	defaultdb
Host	mysql-23492dda-[redacted]-c392.e.aivencloud.com
Port	16879
User	avnadmin
Password	AVNS_[redacted]mAX5
SSL mode	REQUIRED
CA certificate	Show

Write these down somewhere so you don't forget them!!

NOTE: Your port may not be the standard port for MySQL! The standard port for MySQL is typically 3306.

Pro Tip:

Although Aiven.io is nice and provides us with the host, port, user, password and database name for us, many other MySQL providers will provide us with a connection URL such as this:

```
mysql://a0wj08yp3h60iax9:xhov21ul59ilv8e5@jtb9ia3h1pgevwb1.cbetxkdyhwsb.us-east-1.rds.amazonaws.com:3306/kjm3rtal36l1mlue
```

It is important to know how to parse this connection URL into the individual parts.

Below is the same connection URL color coded and labelled to distinguish the key parts of the URL.

mysql://**a0wj08yp3h60iax9**:**xhov21ul59ilv8e5**@**jtb9ia3h1pgevwb1.cbetxkdyhwsb.us-east-1.rds.amazonaws.com**:**3306**/**kjm3rtal36l1mlue**

Protocol:	**mysql**
User:	**a0wj08yp3h60iax9**
Password:	**xhov21ul59ilv8e5**
Host:	**jtb9ia3h1pgevwb1.cbetxkdyhwsb.us-east-1.rds.amazonaws.com**
Port:	**3306**
Database:	**kjm3rtal36l1mlue**
