

Question 1: _____ is an instance of a _____?

- A. Module, Class
- B. Class, Object
- C. Objects, Data Type
- D. Object, Class

Correct Answer: D. Object, Class

Question 2: What is meant by the state of an object?

- A. The value of all its attributes/instance variables at a given time
- B. The value of a variable called state that an object has to initialize
- C. The value of all its public attributes at a given time
- D. None of the above

Correct Answer: A. The value of all its attributes/instance variables at a given time

Question 3: What kind of method is get_species()?

```
class Human:
    _species = "homo sapiens"

    def get_species(cls):
        return cls._species.title()
```

- A. This is not a method and will throw an error
- B. Class Method
- C. A regular method
- D. Static Method

Correct Answer: B. Class Method

Question 4: Methods (excluding static and class methods) represent behaviours of an object.

- A. True
- B. False

Correct Answer: A. True

Question 5: What would be the output?

```
class Cat:
    def __init__(self, name, age):
        self.name = name
        self.age = age
        self.__type = "Tabby"

my_cat = Cat("Garfield", 5)
print(my_cat._Cat__type)
```

- A. Attribute Error
- B. Tabby
- C. Garfield is 5 years old
- D. None

Correct Answer: B. Tabby

Question 6: Is Person a child class of Student?

```
class Student(Person):  
    pass
```

- A. True
- B. False

Correct Answer: B. False

Question 7: What would be the output?

```
class Bird:  
    def __init__(self, name, type_, color):  
        self._name = name  
        self._type = type_  
        self._color = color  
  
class CanadaGoose(Bird):  
    def speak():  
        print("I am angry and I will attack.")  
  
my_canada_goose = CanadaGoose("Zorak", "Canada Goose", "Grey")  
print(isinstance(my_canada_goose, Bird))
```

- A. True
- B. False

Correct Answer: A. True

Question 8: What will be the value of age?

```
class Person():  
    def set_age(self, an_age):  
        if 0 <= an_age <= 150:  
            self._age = an_age  
  
    def get_age(self):  
        return self._age  
  
    age = property(get_age, set_age)  
  
    def __init__(self, name, an_age):  
        self._name = name  
        self.age = an_age  
  
zorak = Person("Zorak", 40)  
zorak.age = 290  
print(zorak.age)
```

- A. 290
- B. Error
- C. 40
- D. None

Correct Answer: C. 40
